

9/11 Truth: The NFPA 921 Manual for Fire and Explosion Investigations can be used as an objective, apolitical tool to prove a new investigation is warranted.

The NFPA 921 Guide for Fire and Explosion Investigations is used by real arson investigators all the time, and several passages in it match the conditions of the WTC destruction to test for explosives/inside job. "Inside job" here isn't meant to be politically charged, only that people with access to the interior of the buildings would be the suspects in this case. The WTC destruction deserves an investigation into the possibility of a larger conspiracy, and this can be proven be necessary without getting political connotations involved whatsoever.

The public should not even have to ask. The political biases of people do not have to get involved, being literate is all that is required.

Here is the 2004 edition: <https://atapars.com/wp-content/uploads/2021/01/atapars.com-NFPA-921-2004.pdf> Can anybody find a 2001 edition ebook?

21.3.2 - High-Order Damage. High-order damage is characterized by shattering of the structure, producing small, pulverized debris. Walls, roofs, and structural members are splintered or shattered, with the building completely demolished. Debris is thrown great distances, possibly hundreds of feet. High-order damage is the result of rapid rates of pressure rise.

Obviously, this applies to the Twin Towers. Large structural steel beams were hurled up to 600 feet away. "Debris thrown great distances" even applies to the WTC 7, because FDNY Captain Richard Rotanz said he saw an entire elevator car that had somehow been "blown away, 30-40 feet" from it's doors in the lobby of WTC 7 before it's collapse. This also fits the description of large objects hurled great distances.

22.2.4.1 - Exotic accelerants have been hypothesized as having been used to start or accelerate some rapidly growing fires and were referred to in these particular instances as high temperature accelerants (HTA). Indicators of exotic accelerants include an exceedingly rapid rate of fire growth, brilliant flares (particularly at the start of the fire), and melted steel or concrete. A study of 25 fires suspected of being associated with HTAs during the 1981–1991 period revealed that there was no conclusive scientific proof of the use of such HTA.

There are at least two credible witnesses to the ends of large steel beams at ground zero being lifted out of the rubble and dripping on the ends. Artifacts from ground zero which museums have officially been claimed to contain molten steel and/or concrete also warrant further study. It's worth at least testing some of the material like Steven Jones did. Steven Jones has identified two ground zero museum artifacts as being iron-based, and deformed as if it had been previously melted. Head of FEMA in New York Pete Bakersky casually mentioned to a newspaper that there were "2700 degree" temperatures in ground zero rubble. A ground zero crew member was also filmed on the scene claiming that he had seen around 2,700 degrees temperatures. Thermal scanning of Lower Manhattan also revealed that

sometimes just the SURFACE temperature of the rubble piles were the melting point of aluminum. This evidence at least warrants suspicion that extremely high temperatures existed at ground zero.

A) Terrorism. The targets set by terrorists may appear to be at random; however, target locations are generally selected with some degree of political or economic significance. Political targets generally include government offices, newspapers, universities, political party headquarters, and military or law enforcement installations. Political terrorists may also target diverse properties such as animal research facilities or abortion clinics. Economic targets may include business offices, distribution facilities of utility providers (e.g., atomic generation plants), banks, or companies thought to have an adverse impact on the environment. Fires or explosions become a means of creating confusion, fear, or anarchy. The terrorist may include fire as but one of a variety of weapons, along with explosives, used in furthering his or her goal.

Obviously 9/11 was terrorism, and saying "But a plane hit the building" is not an excuse to not have an arson investigation. Arsonists often use deception. The hijackers were to DECEIVE their way into obtaining a weapon that could attack the U.S., building fires caused by airplane crashes is ARSON.

18.4.5 - Unusual residues might remain from the initial fuel. Those residues could arise from thermite, magnesium, or other pyrotechnic materials.

Iron microspheres chemically similar to the kind produced by thermitic materials have been identified in the WTC dust by both the USGS and the Stephen Jones gang, with no evidence whatsoever, even written on online forums like ISF, that these iron particles of this composition can be created by building fires or building rubble.

21.4.1.3 Negative Pressure Phase. 21.4.1.3.1 - As the extremely rapid expansion of the positive pressure phase of the explosion moves outward from the origin of the explosion, it displaces, compresses, and heats the ambient surrounding air. A low air pressure condition (relative to ambient) is created at the epicenter or origin. When the positive pressure phase dissipates, air rushes back to the area of origin to equilibrate the low air pressure condition, creating the negative pressure phase.

"Everything went out of me with this massive wind... Stuff was just flying past. Then it stopped and got really quiet, and then everything came back at us. I could breathe at this point, but now I was sucking all that stuff in, too. It was almost like a back draft. It sounded like a tornado." -Former Army sergeant and police officer Sue Keane, *Women at Ground Zero*

23.8.2.2 Shrapnel Injuries. Shrapnel (solid fragments) traveling at high speeds from the epicenter of an explosion can cause amputations, dismemberment, lacerations or perforations resembling stab wounds, localized blunt trauma such as broken and crushed bones, and soft tissue damage.

Can anybody name any more that would fit nicely with the NFPA?

--

Similar to the Ron DiFrancesco story, reporter Carol Marin also described witnessing a fireball exploding from the base of the North Tower as it began collapsing.

Her TedX Talk: <http://www.youtube.com/watch?v=niJJHZ7cjvo&t=14m12s>

"...I was on the west side highway when I saw the first tower fall to the ground. And I kept going, and got around by west street, and there's ash on the ground, and there are firefighters and I show them my ID and one of the firefighters said 'just walk down the middle of the road, because there's falling stuff, and there were stretchers, but nobody was on them, and paramedics waiting.

*And that's when as I'm walking down I feel the ground rumble. And the firefighter ahead of me turns around, screams 'run'. **I could see a fireball come out of the base of the building as- and probably the ignition of jet fuel- as the building began to collapse. But you don't have time to look at those things.** I turned, I fell, he grabbed me by my waist, threw me on my feet, and we ran, and he had the foresight to spot another building that had like a marble overhang, and he slammed me against it, and he covered my body with his. And I'll never- I could feel his heart banging my back bone because it was pounding so hard..."*
